

# Information for participants Bergen 2015

*null*

## Prior readings

- You should be able to perform common tasks in R such as data selection, plotting, loading and installing packages, for loops, etc. If you feel you need a refresher on working with R, google for material, or have a look at the links [here](#)
- If you want to read up a bit on Bayesian stats in advance of the course (not a prerequisite, but it may be helpful to have already heard the most important words), have a look at the recommended reading material [here](#), in particular the nice and free [Bayes intro by Michael Clark](#)

## Preparations and installation of software

- Please make sure the following software is installed on your laptops
- [R](#)
- [Rstudio](#)
- [JAGS](#)
- The R packages [rjags](#) and [R2jags](#)
- Check that everything runs fine by running [the following code](#)

```
library(R2jags)
# Test of the R2jags system
# Modified from the help file of the jags function

# An example model file is given in:
model.file <- system.file(package="R2jags", "model", "schools.txt")
# Let's take a look:
file.show(model.file)
# you can also write BUGS model as a R function, see below:

#####
# initialization #
#####

# data
J <- 8.0
y <- c(28.4,7.9,-2.8,6.8,-0.6,0.6,18.0,12.2)
sd <- c(14.9,10.2,16.3,11.0,9.4,11.4,10.4,17.6)

jags.data <- list("y","sd","J")
jags.params <- c("mu","sigma","theta")
jags.inits <- function(){
  list("mu"=rnorm(1),"sigma"=runif(1),"theta"=rnorm(J))
}
```

```

## You can input data in 4 ways
## 1) data as list of character
jagsfit <- jags(data=list("y","sd","J"), inits=jags.inits, jags.params,
               n.iter=10, model.file=model.file)

## 2) data as character vector of names
jagsfit <- jags(data=c("y","sd","J"), inits=jags.inits, jags.params,
               n.iter=10, model.file=model.file)

## 3) data as named list
jagsfit <- jags(data=list(y=y,sd=sd,J=J), inits=jags.inits, jags.params,
               n.iter=10, model.file=model.file)

## 4) data as a file
fn <- "tmpbugsdata.txt"
dump(c("y","sd","J"), file=fn)
jagsfit <- jags(data=fn, inits=jags.inits, jags.params,
               n.iter=10, model.file=model.file)
unlink("tmpbugsdata.txt")

## You can write bugs model in R as a function

schoolsmodel <- function() {
  for (j in 1:J){
    y[j] ~ dnorm (theta[j], tau.y[j]) # J=8, the number of schools
    tau.y[j] <- pow(sd[j], -2)        # data model: the likelihood
    # tau = 1/sigma^2
  }
  for (j in 1:J){
    theta[j] ~ dnorm (mu, tau)        # hierarchical model for theta
  }
  tau <- pow(sigma, -2)               # tau = 1/sigma^2
  mu ~ dnorm (0.0, 1.0E-6)            # noninformative prior on mu
  sigma ~ dunif (0, 1000)             # noninformative prior on sigma
}

jagsfit <- jags(data=jags.data, inits=jags.inits, jags.params,
               n.iter=10, model.file=schoolsmodel)

#####
# RUN jags and postprocessing #
#####
jagsfit <- jags(data=jags.data, inits=jags.inits, jags.params,
               n.iter=5000, model.file=model.file)

# display the output
print(jagsfit)
plot(jagsfit)

# or to use some plots in coda
# use as.mcmc to convert rjags object into mcmc.list
plot(as.mcmc(jagsfit))

```
